

TECHNICAL DOCUMENTATION

FUNKY CLUB

An Interactive, Multi-Tier E-Commerce Platform for Sustainable Thrift
Sales and Clothing Rental Ecosystems

DEVELOPER :

Archana O P

CORE TECH STACK :

Backend: PHP 8.x, MySQL, Apache (XAMPP Server environment)

Frontend: HTML5, CSS3, Bootstrap Framework, JavaScript, jQuery, Ajax

DATABASE ARCHITECTURE :

Relational Database Schema (`db\_thrift`) consisting of 20 normalized tables, enforcing cross-entity data integrity through structured Foreign Key constraints.

ABSTRACT

This project introduces “**Funky Club**”, a comprehensive online platform designed to redefine the way people access, buy, and rent clothing. With the increasing focus on sustainable fashion and flexible wardrobe solutions, Funky Club provides an innovative solution that caters to users seeking both affordability and variety. The platform addresses the challenges faced by individuals who want access to stylish clothing without the burden of ownership, offering seamless options for renting, buying pre-loved apparel, and selling thrift clothing. By integrating advanced search and filtering options, Funky Club allows users to explore a diverse range of clothing items based on style, size, occasion, and budget, enhancing convenience and personalization.

The platform not only serves end-users but also empowers sellers to efficiently manage their inventory, process orders, and engage with customers through a structured interface. Personalized recommendations, detailed item descriptions, and a robust review system ensure that users make informed decisions while fostering a trustworthy community environment. Additionally, the complaint management feature enables smooth resolution of issues, promoting user satisfaction and reliability.

Administrators have access to a centralized dashboard to monitor platform activities, manage users and sellers, and ensure the quality and authenticity of listings. By combining technology, sustainability, and user-centric design, Funky Club aspires to create a vibrant ecosystem where fashion enthusiasts can interact, share, and access clothing in a manner that is convenient, affordable, and environmentally conscious. Ultimately, Funky Club seeks to transform the traditional clothing marketplace, offering a flexible, eco-friendly, and engaging experience that caters to the evolving needs of modern consumers while promoting sustainable fashion practices.

INTRODUCTION

Fashion is more than just clothing; it is a reflection of personality, creativity, and lifestyle. Our platform, **Funky Club**, is committed to transforming the way individuals access, share, and experience clothing in a modern, sustainable, and convenient manner. We aim to empower users with a seamless online marketplace where they can buy, rent, and sell clothing, creating an ecosystem that promotes both affordability and style.

At the heart of Funky Club is a user-friendly platform designed to serve as a one-stop solution for fashion enthusiasts. Whether looking for trendy outfits for a special occasion, everyday wear, or sustainable pre-loved clothing, the platform caters to a diverse range of needs. Users can easily explore a wide variety of clothing items, filter options based on style, size, occasion, and budget, and make informed choices with the help of detailed descriptions, images, and reviews.

One of the standout features of Funky Club is its flexibility in shopping and wardrobe management. Users can choose to rent clothes for short-term needs, buy thrift items at affordable prices, or sell their own pre-loved clothing, encouraging a circular fashion economy. By offering personalized recommendations and interactive features, the platform ensures that every user's experience is unique and tailored to their preferences.

Beyond transactions, Funky Club focuses on building a vibrant community of users, sellers, and fashion enthusiasts. Through ratings, reviews, and feedback systems, the platform promotes transparency, trust, and collaboration, allowing individuals to share experiences and make informed decisions. Sellers benefit from tools to manage inventory, process orders efficiently, and engage with buyers, creating a professional and reliable marketplace environment.

Ultimately, Funky Club seeks to redefine the fashion marketplace by merging technology, sustainability, and convenience. The platform aims to make stylish clothing accessible to everyone, reduce fashion waste, and inspire users to participate in a collaborative and eco-friendly clothing ecosystem. By providing an engaging, efficient, and community-driven experience, Funky Club aspires to transform the way people perceive, use, and enjoy fashion in their everyday lives.

1.1 EXISTING SYSTEM

The study of the existing system helps to gather information about current practices. In the existing system of clothing marketplaces, users typically access multiple standalone websites or mobile applications to buy, rent, or sell clothes. Customers browse through product listings, view item details, and proceed to purchase or rent items using secure payment gateways. However, the existing system often lacks a unified platform that combines buying, renting, and selling in a single interface, and it provides limited features for personalized recommendations or streamlined inventory management for sellers.

1.1.1 Drawbacks of Existing System

- **Limited Integration:** Many clothing marketplaces operate as separate platforms for buying, renting, or selling clothes. Users often need to visit multiple websites or apps to fulfil different needs, which makes the experience fragmented and inconvenient.
- **Lack of Personalization:** Existing platforms rarely provide fully personalized recommendations based on user preferences, style, or past behaviour. As a result, users may encounter generic listings that do not match their interests, reducing engagement.
- **Outdated Listings:** Items for sale or rent may not be updated in real-time, leading to users finding products unavailable or already sold. This can cause frustration and reduce trust in the platform.
- **Complex Navigation:** Many existing sites have cluttered interfaces, making it difficult for users to browse items, track orders, or manage their profiles. Poor organization can result in users abandoning the platform.
- **Limited Seller Tools:** Sellers often face challenges in managing inventory, tracking orders, and interacting with customers efficiently. This can reduce the overall quality of service and seller satisfaction.
- **High Competition:** The online fashion and thrift marketplace is crowded with many platforms offering similar services. Users may feel overwhelmed by the options, and sellers may struggle to attract buyers without additional promotion.
- **Security Concerns:** Platforms handling payment and personal information without robust security measures may deter users from completing transactions, affecting both buyers and sellers.

- **Lack of Community Features:** Existing systems may not provide ways for users to review, rate, or interact with sellers or other buyers, which reduces trust and engagement in the platform.
- **Technical Issues:** Websites or apps can suffer from bugs, downtime, or slow loading times, especially during peak hours. Such issues negatively impact user experience and loyalty.
- **Lack of Community Features:** Existing systems may not provide ways for users to review, rate, or interact with sellers or other buyers, which reduces trust and engagement in the platform.
- **Technical Issues:** Websites or apps can suffer from bugs, downtime, or slow loading times, especially during peak hours. Such issues negatively impact user experience and loyalty.

1.1.2 System Analysis

The existing clothing marketplaces often operate through separate platforms for buying, selling, and renting, relying on partially manual processes that lead to inefficiencies such as delayed order processing, inconsistent inventory tracking, and limited user engagement. These issues affect both customer satisfaction and seller performance. To address these challenges, a new system is proposed with fully integrated processes and enhanced functionality. The proposed system will provide a unified platform for managing clothing transactions, including purchasing, renting, and selling, along with efficient order management, inventory control, and complaint handling. It will offer secure payment processing, real-time updates on item availability, and personalized recommendations to improve the overall user experience.

In addition to functional improvements, the system will meet key non-functional requirements, such as an intuitive user interface, high scalability to accommodate growing users and sellers, robust security measures for data and transactions, and fast, reliable performance. A feasibility study indicates that implementing the system is technically, economically, and operationally viable, ensuring compliance with relevant data protection regulations. Leveraging modern web technologies and cloud-based infrastructure where needed, the new design will facilitate seamless interaction among users, sellers, and administrators, enhancing operational efficiency and creating a trusted, sustainable, and user-centric marketplace. This analysis underscores the critical need for the proposed system to elevate both platform performance and user satisfaction in the evolving online clothing ecosystem.

1.2 PROPOSED SYSTEM

The objective of the proposed system is to provide a unified, user-friendly platform for buying, renting, and selling clothing with personalized recommendations based on user preferences. The system is designed with intuitive navigation, enabling users to interact with the website conveniently and enter data accurately. It includes features for browsing items, managing orders, handling rentals, and submitting complaints. Sellers can efficiently manage their inventory, track sales, and respond to user queries.

Administrators have full control over monitoring activities, managing users and sellers, and generating comprehensive reports. The system aims to ensure a seamless and engaging experience for all stakeholders while promoting sustainable and flexible fashion consumption.

1.2.1 Advantages of Proposed System

- **Convenience:** Users can browse, rent, or buy clothing anytime and from anywhere without visiting physical stores.
- **Wide Range of Options:** The platform offers a diverse collection of thrift and rental clothing, allowing users to compare styles, prices, and availability easily.
- **Personalized Recommendations:** Users receive suggestions based on their preferences, past activity, and style choices, enhancing the shopping experience.
- **Time-Saving:** Users can quickly find items, place orders, and manage rentals efficiently, streamlining the process of obtaining clothing.
- **Secure Transactions:** The system incorporates secure payment gateways, ensuring safe purchases and rentals.
- **Comprehensive Information:** Detailed product descriptions, images, and reviews help users make informed decisions.
- **24/7 Access:** The platform is available at all times, allowing uninterrupted browsing, buying, renting, or selling.
- **Efficient Management:** Sellers can manage inventory, track orders, and respond to complaints effectively, while administrators can generate reports and monitor activities to maintain system quality.

1.3 FEASIBILITY STUDY

During the system analysis, a feasibility study of the proposed system was carried out to determine its benefits and practicality. There is currently no single platform that integrates buying, renting, and selling of clothing in a unified interface while providing personalized recommendations. The proposed system will help users browse, rent, and purchase clothing easily, while also providing sellers with efficient inventory and order management tools. If the proposed system operates without causing losses, it can be considered economically and financially feasible.

- Technical Feasibility
- Economic Feasibility
- Behavioural Feasibility

1.3.1 Technical Feasibility

- **System Architecture:** Assess whether the proposed platform's architecture and technology stack (HTML, CSS, JavaScript, Python/Flask, database) are feasible. Ensure the required hardware, software, and network infrastructure can support all functionalities.
- **Data Sources:** Evaluate the availability and accessibility of data sources for clothing items, rental durations, pricing, and user preferences. Determine if integration with APIs for payment gateways and real-time inventory updates is feasible.
- **Scalability:** Examine whether the system can scale to accommodate increased demand during peak shopping periods and growth in users or sellers. Ensure the technology can handle potential expansion.
- **Security:** Assess the platform's security measures to protect user data, payment information, and transactions. Ensure compliance with data privacy regulations and cybersecurity standards.
- **Integration:** Consider how the system will integrate with existing services such as payment gateways, notifications, and reporting tools. Ensure smooth data flow and minimal disruption during implementation.

1.3.2 Economic Feasibility

- **Cost Estimation:** Prepare a detailed cost estimate for the development, implementation, and ongoing operation of the system. Include expenses for hardware, software, personnel, and marketing.
- **Revenue Projections:** Calculate revenue projections based on factors such as membership fees, commissions on sales and rentals, and potential partnerships with sellers or fashion brands.
- **Return on Investment (ROI):** Calculate the ROI by comparing projected revenue to estimated costs. Determine the payback period and assess financial viability.
- **Cost-Benefit Analysis:** Perform a comprehensive cost-benefit analysis, considering advantages such as streamlined buying and renting, reduced inventory management effort for sellers, and increased customer engagement.

1.3.3 Behavioural Feasibility

The developed system is fully user-friendly and intuitive. The platform is built using HTML, CSS, JavaScript, and Python/Flask for the front end and backend functionality. New users can navigate the website without prior technical skills. Reports, order summaries, and inventory data will be generated as per requirements, ensuring efficiency for both users and sellers.

SYSTEM SPECIFICATION

2. SYSTEM SPECIFICATION

2.1 ABOUT THE FRONT-END HTML

HTML is a computer language devised to allow Website creation. These Websites can then be viewed by anyone else connected to the Internet. It is relatively easy to learn, with the basics being accessible to most people in one sitting; and quite powerful in what it allows you to create. It is constantly undergoing revision and evolution to meet the demands and requirements of the growing Internet audience under the direction of the W3C, the organization charged with designing and maintaining the language.

HTML consists of a series of short codes typed into a text-file by the site author these are the tags. The text is then saved as a HTML file, and viewed through a browser, like Internet Explorer. This browser reads the file and translates the text into a visible form, hopefully rendering the page as the author had intended. Writing your own HTML entails using tags correctly to create your vision. You can use anything from a rudimentary text editor to a powerful graphical editor to create HTML pages.

CSS :

Stands for "Cascading Style Sheet." Cascading style sheets are used to format the layout of Web pages. They can be used to define text styles, table sizes, and other aspects of Web pages that previously could only be defined in a page's HTML. CSS helps Web developers create a uniform look across several pages of a Web site. Instead of defining the style of each table and each block of text within a page's HTML, commonly used styles need to be defined only once in a CSS document. Once the style is defined in cascading style sheet, it can be used by any page that references the CSS file. Plus, CSS makes it easy to change styles across several pages at once. For example, a Web developer may want to increase the default text size from 10pt to 12pt for fifty pages of a Web site. If the pages all reference the same style sheet, the text size only needs to be changed on the style sheet and all the pages will show the larger text.

While CSS is great for creating text styles, it is helpful for formatting other aspects of Web page layout as well. For example, CSS can be used to define the cell padding of table cells, the style, thickness, and colour of a table's border, and the padding around images or other objects. CSS gives Web developers more exact control over how Web pages will look than HTML does. This is why most Web pages today incorporate cascading style sheets.

Ajax :

Ajax is a set of web development techniques using many web technologies on the client side to create asynchronous web applications. With Ajax, web applications can send and retrieve data from a server asynchronously (in the background) without interfering with the display and behaviour of the existing page. By decoupling the data interchange layer from the presentation layer, Ajax allows web pages and, by extension, web applications, to change content dynamically without the need to reload the entire page. In practice, modern implementations commonly utilize JSON instead of XML.

jQuery :

jQuery is a JavaScript library designed to simplify HTML DOM tree traversal. And manipulation, as well as event handling, CSS animation, and Ajax. It is free, open-source software using the permissive MIT License. As of May 2019, jQuery is used by 73% of the 10 million most popular websites. Web analysis indicates that it is the most widely deployed JavaScript library by a large margin, having 3 to 4 times more usage than any other JavaScript library.

Bootstrap :

Bootstrap is a free and open-source CSS framework directed at responsive, mobile first front-end web development. It contains CSS- and (optionally) JavaScript based design templates for typography, forms, buttons, navigation and other interface components.

JavaScript :

JavaScript is a dynamic computer programming language. It is lightweight and most commonly used as a part of Web pages, whose implementations allow client-side script to interact with the user and make dynamic pages. It is an interpreted programming language with object-oriented capabilities. JavaScript was first known as Live Script, but Netscape changed its name to JavaScript, possibly because of the excitement being generated by Java. JavaScript made its first appearance in Netscape 2.0 in 1995 with the name Live Script. The general-purpose core of the language has been embedded in Netscape, Internet Explorer, and other Web browsers.

2.2 ABOUT THE BACK END

The system is created with PHP, MySQL and XAMPP Server as back end.

PHP :

PHP started out as a small open-source project that evolved as more and more people found out how useful it was. Rasmus Lerdorf unleashed the first version of PHP way back in 1994. PHP is a must for students and working professionals to become a great Software Engineer specially when they are working in Web Development Domain. The key advantages of learning PHP are:

PHP is a recursive acronym for "PHP: Hypertext Pre-processor". PHP is a server-side scripting language that is embedded in HTML. It is used to manage dynamic content, databases, session tracking, even build entire e-commerce sites. It is integrated with a number of popular databases, including MySQL, PostgreSQL, Oracle, Sybase, Informix, and Microsoft SQL Server .PHP is pleasingly zippy in its execution, especially when compiled as an Apache module on the Unix side. The MySQL server, once started, executes even very complex queries with huge result sets in record-setting time. PHP supports a large number of major protocols such as POP3, IMAP, and LDAP.PHP4 added support for Java and distributed object architectures (COM and CORBA), making n-tier development a possibility for the first time .PHP is forgiving:

PHP language tries to be as forgiving as possible. PHP Syntax is C-Like.

MYSQL:

MySQL is an open-source relational database management system (RDBMS).Its name is a combination of "My", the name of co-founder Michael Wideness's daughter and "SQL", the abbreviation for Structured Query Language. MySQL is free and opensource software under the terms of the GNU General Public License and is also available under a variety of proprietary licenses. MySQL was owned and sponsored by the Swedish company MySQL AB, which was bought by Sun Microsystems (now Oracle Corporation). In 2010, when Oracle acquired Sun, Widenius forked the opensource MySQL project to create MariaDB. MySQL is a component of the LAMP web application software stack (and others), which is an acronym for Linux, Apache, MySQL, Perl/PHP/Python. MySQL is used by many database-driven web applications, including Drupal, Joomla, phpBB, and WordPress. MySQL is also used by many popular websites, including Facebook, Flickr, Media Wiki, Twitter, and YouTube.

XAMP Server :

XAMP is an acronym that stands for Windows , Apache , MySQL and PHP. It's a software stack which means installing WAMP installs Apache , MySQL , and PHP on your operating system(Windows in the case of WAMP).Even though you can install them separately, they are usually bundled up, and for a good reason too.

What's good to know is that WAMP derives from LAMP(the L stands for Linux).The only difference between these two is that WAMP is used for Windows ,while LAMP for Linux based operating systems. A database system is an overall collection of different database software components and database containing the part viz. Database application programs, frontend components, Database management systems and Database.

A database system must provide the following features:

- A variety of user interfaces
- Physical data independence
- Logical data independence
- Query optimization
- Data integrity
- Concurrency control
- Backup and recovery
- Security and authentication

When creating a database, the main concept is to know how the database is structured in SQL. SQL stands for Structured Query Language. It is a language that enables us to create and operate on relational database, which are sets of related information stored in tables. Because of its elegance and independence.

2.3 ABOUT THE OS

The OS used is Windows Operating System.

WINDOWS OS

The hall mark software of Microsoft, which had created a new wave of graphical user interface in the industry, WINDOWS XP stands in the top of its popularity. The advent of Microsoft plus has cured whatever faults were there in the original WINDOWS XP version and made it and useful tool to work with the memory resident programs of it, make the reloading of WINDOWS XP easier, it plugs and play connectivity for input output devices makes a new dimension towards the use of computer system. Connectivity to the information network slice Internet through modems makes it overstate software. Almost all new software has their windows version also. The programmer and file manager facilities of it had made a leap way towards giving a new dimension towards the operation of computer systems.

SYSTEM ANALYSIS AND DESIGN

3. SYSTEM ANALYSIS AND DESIGN

System design's main aim is to identify the modules that should be in the system, and the specifications of these modules and how they interact with each other to produce the desired results. At the end of the system design all the major data structures, file formats and the major modules in the system and their specification are decided.

3.1 DATA FLOW DIAGRAM

A DFD has the purpose of clarifying system requirements and identifying major transformations that will become programs in system design.

These symbols are used in the DFD.

Source or destination of data

Data Flow

Process that transforms data flow

Data store

Fig 3.1: DFD SYMBOLS

Fig 3.2: Level 0 DFD

Fig 3.3: Level 1-Admin DFD

Fig 3.4: Level 1-Seller DFD

Fig 3.5: Level 1-User DFD

3.2 TABLE DESIGN

The general theme behind a database is to handle information as an integrated whole. A database is a collection of interrelated data stored with minimum redundancy to serve quick access and effective storage. The database is a collection of stored data organized in such a way that all the data requirements are satisfied by the database.

The aim of database design is to improve the existing system situation. A number of database files were designed to hold the data requirements for running their systems. Here we have 20 major tables, described below.

TABLE OVERVIEW

DATABASE: DB_THRIFT

SL.NO	TABLE NAME	DESCRIPTION
1.	tbl_admin	To store admin details
2.	tbl_booking	To store thrift booking details
3.	tbl_cart	To store cart details
4.	tbl_category	To store category details
5.	tbl_color	To store color details
6.	tbl_complaint	To store complaint details
7.	tbl_district	To store district details
8.	tbl_gallery	To store gallery details

9.	tbl_gender	To store gender details
10.	tbl_material	To store material details
11.	tbl_place	To store place details
12.	tbl_product	To store thrift product details
13.	tbl_rating	To store rating details
14.	tbl_rentproductbooking	To store rent products booking details
15.	tbl_rentproducts	To store rent products details

3.3 INPUT DESIGN

Input is the process of converting user inputs to computer-based format. The project requires a set of information from the user to prepare a report. In the order, when organized input data are needed. In the system design phase, the expanded DFD identifies logical data flow, data stores and destination. Input data is collected and organized into groups of similar data. The goal behind designing input data is to make the data entry easy and make it free from logical error. So, the input screens in the system should be flexible and faster to use. The input entry to all type of user is the Email and password. If they are valid the user is allowed to enter into the Web page.

Objectives

- To produce a cost-effective method of input.
- To achieve the highest possible level of accuracy.
- To ensure that the input is acceptable and understandable.
- To make clutter free screens.
- The prevention of irrelevant data entry.
- To make a user-friendly input screen.

Here in my system, 'FUNKY CLUB' interactive input screens ensure the reliability and accuracy of the system. The intended input details, product details etc...entry and modification of personal details can be done easily. All data entry screens should be interactive nature. The input design determines whether the user can interact directly with the computer. With input design, we can say that it is more user friendly as compared to the existing manual system containing paper operations.

a) Login -

This form consists of username and password. Admin, User, and Seller can log in through this form to access their respective dashboards and functionalities.

b) Registration Form –

There is a registration form for users and sellers. The registration form for users consists of name, contact, email, address, photo, and password. Sellers will have a separate registration form, which includes details like name, contact, email, store name, address, and password. Admins also have a separate registration with basic details like name, email, and password.

c) Browse Products –

Users can view available clothing items for sale or rent, filter them by category, size, color, material, or gender, and select items according to their preferences.

d) Booking / Orders –

Users can view their purchase or rental history, including the status of orders and rental periods. They can also track the delivery or return of rented items.

e) Complaint –

If a user faces any issues with purchased or rented items, sellers, or the platform itself, they can submit a complaint for resolution.

f) Edit Profile –

This form allows users to update their personal details such as name, contact, email, address, and photo whenever necessary.

g) Change Password –

This form consists of the current password, new password, and confirm password fields for secure account management.

h) Payment –

Users can make payments for purchased or rented items using multiple methods, including debit cards, credit cards, or online payment gateways.

3.4 OUTPUT DESIGN

Outputs are the most important direct source of information for the users, sellers, and administrators. Efficient and well-organized output design improves the system's usability, strengthens its relationship with stakeholders, and aids in decision-making. Output design generally deals with the results generated by the system, such as reports, order details, and user activity summaries. These outputs can be generated from stored or calculated data and displayed on the screen or in printed form. While end-users may not interact with the system's backend directly, they rely on these outputs for a smooth experience.

ADMIN PAGE

This section of the website contains six main tabs: Dashboard, Users, Sellers, Complaints, Orders, and Reports.

1. **Dashboard:** Displays an overview of the platform's activity, including total users, active sellers, orders placed, rented items, and popular clothing categories.
2. **Users:** Allows the admin to view, manage, and monitor all registered users. Admins can update user status, manage complaints, or remove inactive accounts.
3. **Sellers:** Provides functionality to manage registered sellers, including approval, verification, and monitoring of seller activity and inventory.
4. **Complaints:** Displays all complaints submitted by users about products, rentals, or sellers. Admins can review, respond, and resolve issues directly.
5. **Orders:** Shows all purchase and rental orders with details such as item, buyer, status, rental period, and payment confirmation. Admin can update order status (e.g., confirmed, canceled, delivered).
6. **Reports:** Generates detailed reports on users, sellers, orders, complaints, and overall platform activity for performance analysis and decision-making.
7. **Logout:** Allows the admin to securely exit the dashboard.

USER PAGE

The user section contains six key tabs: Browse, Cart, Orders, Rentals, Complaints, and Profile.

1. **Browse:** Users can explore clothing items available for purchase or rent, filter by category, size, color, material, or gender, and view detailed product descriptions.
2. **Cart:** Displays items selected for purchase or rent, allowing users to review and modify their selections before checkout.
3. **Orders:** Lists all confirmed and pending purchases with details including item, quantity, price, and order status.
4. **Rentals:** Shows rented clothing items, rental duration, and status (active, returned, overdue). Users can track their rented items efficiently.
5. **Complaints:** Users can submit complaints related to products, rentals, or any technical issues encountered on the platform.
6. **Profile:** Displays the user's profile information, including name, contact details, address, and preferences. Users can edit their profile and change their password securely.

SELLER PAGE

The seller section contains six main tabs: Products, Orders, Rentals, Complaints, Reports, and Profile.

1. **Products:** Allows sellers to add, update, and manage clothing items available for sale or rent, including images, price, stock, size, color, and material.
2. **Orders:** Displays all purchase orders placed by users, with details of items, quantity, and status. Sellers can update the order status (e.g., shipped, delivered).
3. **Rentals:** Shows all items rented by users, rental periods, and status. Sellers can track active rentals and returns.
4. **Complaints:** Displays complaints submitted by users about products or services. Sellers can respond and resolve issues directly.
5. **Reports:** Generates reports on sales, rentals, and inventory for performance analysis.
6. **Profile:** Allows sellers to view and update their personal and store details, including contact information and password.

3.5 MENU DESIGN

Menus are designed for the manipulation of the screen. Menu is a universal interface for any type of environment. The menu allows the user's choice of response but reduces the chances of error in data.

There is a main window, which contains the main menu. By using the appropriate menu option, we select screens or windows for input data entry. Access protection is achieved through the password. The user can enter into the main window only by giving the correct username and password. Menu provides a set of options on the screen. Cursor movements can select the options. The application consists of a number of data manipulation screens. By clicking on the options or menu items, we can go to the desired section.

a) When the **Admin** logs in, he/she will enter the **dashboard**, where there are six pulldown menus.

They are Category, Location, Complaint, User List, Seller Verification, and Logout. The Category tab allows the admin to add and manage categories, subcategories, sizes, colors, and materials for clothing items. The Location tab enables the admin to manage location-related details, such as districts and places, ensuring accurate categorization for sellers and users. The Complaint tab allows the admin to view complaints submitted by users or sellers and provide appropriate replies or resolutions. The User List tab displays all registered users, allowing the admin to monitor and manage user accounts effectively. The Seller Verification tab helps the admin review and verify seller registrations before granting access to upload or sell thrift and rental products. Using the Logout tab, the admin can securely exit the admin panel.

b) When the Seller logs in, he/she will enter the seller dashboard, where there are five tabs.

They are Products, Orders, Complaints, Profile, and Logout.

On the Products tab, the seller can add new thrift with details such as name, size, price, material, and photos etc. On the Orders tab, the seller can view the orders placed by users for their listed products, including order status and payment details. The Complaints tab allows sellers to view and respond to user complaints regarding their products. The Profile tab displays user details and allows editing of profile information or changing the password. Using the Logout tab, the seller can exit the seller page securely.

c) When the User logs in, he/she will enter into the home page, where there are six main tabs.

They are Shop, Rent, Cart, Orders, Complaints, Profile, and Logout. On the Shop tab, the user can browse thrift clothing items available for purchase, view details, and add them to the cart. On the Rent tab, users can browse available rental clothes or upload their own clothes for rent. On the Cart tab, users can view the products they have added and proceed to checkout for payment. The Orders tab allows users to view all purchased and rented items, including delivery status and booking details. The Complaints tab enables users to register complaints regarding products or transactions. The Profile tab displays user details and allows editing of profile information or changing the password. Using the Logout tab, the user can securely log out from the user page.

d) When a Guest visits the website, he/she can access the Home, Login, User Registration, and Seller Registration options.

The Home page provides an overview of the platform, featured sellers, and trending products. The Login option allows guests to sign in as an Admin, User, or Seller by providing valid credentials. The User Registration tab enables new users to create an account by entering their personal details, contact information, and login credentials. The Seller Registration tab allows sellers to register by submitting necessary details and verification information to start listing their thrift and rental products.

SYSTEM DESCRIPTION

4. SYSTEM DESCRIPTION

The proposed system, “**Funky Club**”, is a dynamic and user-friendly online platform designed to transform how people access, buy, and rent clothing. The system focuses on promoting sustainable fashion by offering users the flexibility to purchase thrift items or rent fashionable apparel for various occasions. The platform consists of four primary modules **Admin Module, Seller Module, User Module, and Guest Module** each developed to ensure smooth operation, secure data handling, and a personalized experience for every stakeholder.

Admin Module

The **Admin Module** serves as the control center of the platform, enabling administrators to monitor, manage, and maintain all system activities. It ensures that user interactions, seller operations, and product listings comply with the platform’s standards of quality and trust. Key features include:

- **Category Management:** Add and manage product categories, subcategories, colors, sizes, and materials to maintain an organized clothing database.
- **Location Management:** Add and update destinations, including districts and places, ensuring an updated and diverse destination database.
- **User List Monitoring:** View all registered users and manage their activity to maintain a secure and transparent user environment.
- **Complaint Handling:** View and respond to user complaints, maintaining transparency and customer satisfaction.
- **Seller Verification:** Review and verify new seller registrations before approving them to list products for sale or rent.
- **System Monitoring:** Ensure the platform runs smoothly, addressing technical issues promptly.
- **Logout:** Securely exit the admin panel after completing management tasks.

User Module

The **User Module** focuses on providing an engaging and seamless shopping and rental experience. It offers multiple browsing and management options for users to explore products, make purchases, or rent clothing items easily. Core functionalities include:

- **Shop:** Browse available thrift items for sale, view detailed product information, and add items to the cart for purchase.
- **Rent:** Explore clothes available for rent or upload one's own items for rental, promoting circular fashion.
- **Cart Management:** View selected items, manage quantities, and proceed to checkout for secure payments.
- **Order Tracking:** View details of all purchased and rented products, including order status, delivery updates, and booking details.
- **Complaint Submission:** Register complaints related to products or transactions for quick administrative resolution.
- **Profile Management:** Edit user details, update contact information, and change passwords securely.
- **Logout:** Safely exit the user dashboard after completing activities.

Seller Module

The **Seller Module** is designed to empower individual sellers to showcase and manage their thrift and rental clothing collections. Through an intuitive dashboard, sellers can efficiently upload, edit, and monitor their listings. Key features include:

- **Product Management:** Add, edit, or delete clothing listings with details such as name, price, material, size, and images.
- **Order Management:** View and track all purchase and rental orders placed by users, including order status and payment information.
- **Complaint Response:** Access complaints submitted by users regarding products and provide appropriate responses or resolutions.
- **Profile Management:** View and update profile details, contact information, and change passwords to maintain security.
- **Logout:** Exit the seller account securely after completing operations.

Guest Module

The **Guest Module** caters to visitors who have not yet registered or logged in. It serves as an introduction to the platform, encouraging engagement through accessible navigation options. Key functionalities include:

- **Home Page:** Provides an overview of the Funky Club platform, featuring trending thrift and rental collections, top sellers, and popular products.
- **Login Access:** Allows guests to log in as an Admin, Seller, or User using valid credentials.
- **User Registration:** Enables new users to register by entering basic personal details and login information.
- **Seller Registration:** Allows potential sellers to sign up by providing necessary business and verification details to start listing products.

SYSTEM TESTING AND IMPLEMENTATION

5. SYSTEM TESTING AND IMPLEMENTATION

Software testing is a critical element of system quality assurance and represents the ultimate reviews of specification, design and coding. Testing presents an interesting anomaly for the software. Testing is vital to the success of the system. Errors can be injected at any stage during development. System testing makes a logical assumption that if all the parts of the system are correct, the goal will be successfully achieved. During testing, the program to be tested is executed with set of test data and the output of the program for the test data is evaluated to determine if the program is performing as expected. A series of testing are performed for the proposed system before the system is ready for the user acceptance testing.

TYPES OF TESTING:

- Unit Testing
- Integration Testing
- Validation Testing
- Output Testing

5.1 SYSTEM TESTING

5.1.1 UNIT TESTING

Unit testing focuses verification effort on the smallest unit of the software design, the module this is known as module testing. Since the proposed system as modules the testing is individually performed on each module. Using the details description as a guide, important control paths are tested to uncover errors within the boundary of The modules. This testing was carried out during programming stage itself. In This testing step each module is found to be working satisfactorily as regards to the expected output from the module. In our system, we want to check the information like whether the inputs are saved to back end correctly. So every form includes this testing because we want to maintain our database because information like document to be saved, the personal information, security features are so sensitive and should check it perfectly by each module from the beginning. These are checked in the programming step itself.

5.1.2 INTEGRATION TESTING

Data can be test across an interface, one module can have adverse effect on another, sub function when combined may not produced the desired function. Integration testing is a systematic technique for constructing the program structure while at the same time conducting test to uncover errors associated within the interface. The objective is to take unit tested modules and built a program structure that has been dictated by design. All modules are combined in this testing step. The entire program is tested as a whole. Correction is difficult at this stage because the isolation of causes is complicated by the vast expense of the program. Thus in the integration testing step all the errors uncover are corrected for the next testing step. Primarily we have met with several errors like data save and table linking. These are corrected well.

5.1.3 VAIDATION TESTING

At the culmination of integration testing, software is completely assembled as a package. Interfacing errors have been uncovered and corrected and a final series of software test-validation testing begins. Validation testing can be defined in many ways, but a simple definition is that validation succeeds when the software functions in manner that is reasonably expected by the user. Software validation is achieved through a series of tests that demonstrate conformity with requirement. After validation test has been conducted, one of two conditions exists.

- The function or performance characteristics confirm to specificationsand are accepted.
- A validation from specification is uncovered and a deficiency created. Deviation or error discovered at this step in this project is corrected prior to completion of the project with the help of the user. Thus the proposed system under consideration has been tested by using validation testing and found to be working satisfactorily.

5.1.4 OUTPUT TESTING

After performing the validation testing, the next step is output testing of the proposed system since no system could be useful if it does not produce the required output in the specific format. The output generated or displayed by the system under consideration is tested asking the users about the format required by them. In the first test, we saw that our services are disordered and not interactive. We made it in this step. The output format on the screen is found to be correct as the format designed according to the user needs. For the hard copy also, the output comes out as specified by the user. Hence output testing doesn't result in any connection in the system.

5.2 SYSTEM IMPLEMENTATION

Implementation is the stage in the project where the theoretical design is turned into a working system and is giving confidence on the new system for the users, that it will work efficiently and effectively. It involves careful planning, investigation of the current system and its constraints implementation, design of methods to achieve the change over, an evaluation, of change over methods. Implementation is the final and important phase. The most critical stage in achieving a successful new system and in giving the users confidence that the new system will work and be effective. The system can be implemented only after through testing is done and if it found to working according to the specification. This method also offers the greatest security since the old system can take over if the errors are found or inability to handle certain type of transactions while using the new system. At the beginning of the development phase a preliminary implementation plan is created to schedule and manage the many different activities must be integrated into plan. The implementation plan is updated throughout the development phase, culminating in A changeover plan for the operation phase. The major elements of implementation plan are test plan, training plan, equipment installation plan and a conversion plan. There are three types of implementation:

- Implementation of a computer system to replace a manual system.
- Implementation of a new computer system to replace an existing one.
- Implementation of a modified application to replace an existing one, using the same computer

CONCLUSION

The project entitled “**FUNKY CLUB**” was successfully completed within the scheduled time. This project provided maximum interaction and flexibility to both users and sellers. The system was thoroughly tested, and its performance proved to be efficient, ensuring reliable data management and smooth functionality across all modules. The entire system has been designed with an attractive and user-friendly interface to ensure easy navigation for all types of users. The modular structure of the system allowed for faster development, implementation, and maintenance of the software.

The system was developed using **HTML, CSS, Bootstrap, JavaScript, PHP, MySQL, and XAMPP Server**, and tested with multiple data samples to ensure accuracy and stability. Each module Admin, Seller, User, and Guest was tested individually and integrated successfully to form a unified platform. The results confirmed that the system fulfills all the objectives identified during the planning and analysis stages.

Overall, the performance of the **Funky Club** system is efficient and meets the requirements of a modern thrift and rental clothing platform. It minimizes manual effort, simplifies the buying and renting process, and promotes sustainability by encouraging reuse of clothing. The system also requires minimal hardware and provides a secure environment for online transactions.

In conclusion, we can confidently state that **Funky Club** achieves its goal of providing an innovative, accessible, and eco-friendly platform for users and sellers alike. We extend our sincere gratitude to everyone who supported and guided us throughout the successful completion of this project.
